Chapter 1

Introduction

1.1 Canonical Correlation Analysis (CCA)

CCA statistically finds the correlation between two sets of random variables X and Y (Hotelling, 1936). Denote

$$X = (x_1, \dots, x_p) \in R^{N \times p}, Y = (y_1, \dots, y_q) \in R^{N \times q}.$$

X and Y can be two feature spaces, or a feature space and a label space. To obtain the correlation between the two sets of variables, CCA finds a linear projection u in the space of X , and a linear projection v in the space of Y to maximize the following sample correlation.

Such that the projected data $u'X$ and $v'Y$ have a maximum correlation.

$$\rho_{CCA} = \operatorname{argmax}_{u \in R^p, v \in R^q} \frac{u'X'Yv}{\sqrt{(u'X'Xu)(v'Y'Yv)}}$$

1.2 Kernel Canonical Correlation Analysis (KCCA)

The KCCA provides a nonlinear extension of CCA, which catches the nonlinear correlation by mapping the data into a higher-dimensional feature space before performing CCA.

Figure 2: Kernel CCA

Chapter 2

Mathematical Formulation

2.1 Formulation

a. Input-X and Input-Y are normalized.

b. Normalized x and y are transformed into the Hilbert space,

$\phi_X(x) \in H_X$ and $\phi_Y(y) \in H_Y$.

Objective function of KCCA is:

$$\begin{aligned} \max_{\mathbf{w}_x, \mathbf{w}_y} \quad & \mathbf{w}_x^T \Phi_x \Phi_y^T \mathbf{w}_y \\ \text{s.t.} \quad & \mathbf{w}_x^T \Phi_x \Phi_x^T \mathbf{w}_x = 1, \mathbf{w}_y^T \Phi_y \Phi_y^T \mathbf{w}_y = 1. \end{aligned}$$

Expressing \mathbf{w}_x and \mathbf{w}_y as linear combinations of the columns of ϕ_X and ϕ_Y , respectively.

$$\mathbf{w}_x = \phi_X \mathbf{a}$$

$$\mathbf{w}_y = \phi_Y \mathbf{b}$$

where \mathbf{a} and \mathbf{b} are linear coefficients.

c. Let $K_X = (\phi_X^T \phi_X)$ and $K_Y = (\phi_Y^T \phi_Y)$ be kernel matrices, i.e., $(K_X)_{ij} = \kappa(x_i, x_j)$, where κ is a kernel function, such as a radial basis function (RBF).

$$K(X_1, X_2) = \exp\left(-\frac{\|X_1 - X_2\|^2}{2}\right)$$

d. After applying kernel function, we can further add regularizations to kernel matrices to make it more stable.

Replacing $K_X.K_X$ by $K_X.K_X + r_X.K_X$ and $K_Y.K_Y$ by $K_Y.K_Y + r_Y.K_Y$

Where r_X, r_Y are regularization parameter

e. Now solving it by singular value decomposition to find \mathbf{a}, \mathbf{b} .

$$\begin{aligned} & \begin{bmatrix} \mathbf{0} & K_X K_Y \\ K_Y K_X & \mathbf{0} \end{bmatrix} \begin{bmatrix} \mathbf{a} \\ \mathbf{b} \end{bmatrix} \\ &= \lambda \begin{bmatrix} K_X K_X + r_X K_X & \mathbf{0} \\ \mathbf{0} & K_Y K_Y + r_Y K_Y \end{bmatrix} \begin{bmatrix} \mathbf{a} \\ \mathbf{b} \end{bmatrix} \end{aligned}$$

$$\begin{array}{c}
 \begin{array}{ccc}
 \begin{array}{|c|} \hline \square \\ \hline \end{array} & \begin{array}{|c|c|c|} \hline \square & \square & \square \\ \hline \end{array} & \begin{array}{|c|c|} \hline \square & \square \\ \hline \end{array} \\
 \mathbf{M} & \mathbf{U} & \mathbf{\Sigma} \\
 m \times n & m \times m & m \times n
 \end{array} \\
 \\
 \begin{array}{ccc}
 \begin{array}{|c|c|} \hline \square & \square \\ \hline \end{array} & \begin{array}{|c|c|} \hline \square & \square \\ \hline \end{array} & \begin{array}{|c|c|c|} \hline 1 & 0 & 0 \\ \hline \end{array} \\
 \mathbf{U} & \mathbf{U}^* & = \mathbf{I}_m
 \end{array} \\
 \\
 \begin{array}{ccc}
 \begin{array}{|c|c|} \hline \square & \square \\ \hline \end{array} & \begin{array}{|c|c|} \hline \square & \square \\ \hline \end{array} & \begin{array}{|c|c|c|} \hline 1 & 0 & 0 \\ \hline \end{array} \\
 \mathbf{V} & \mathbf{V}^* & = \mathbf{I}_n
 \end{array}
 \end{array}$$

f. Calculating w_x , w_y will give the KCCA transformed matrices. Where, w_x and w_y are calculated as follows:

$$w_x = \phi_x.a$$

$$w_y = \phi_y.b$$

g. Finally transforming matrices to same space by projecting it by using following formula:

$$X_{\text{new}} = (w_x^T).X$$

$$Y_{\text{new}} = (w_y^T).Y$$

Chapter 3

Algorithm

In this section, we give an overview of the KCCA algorithms where we formulate the optimization problem as a standard eigen problem.

3.1 KCCA algorithm

1. Normalized the given input data (X , Y) of dimension $n \times p$ and $n \times q$ respectively.
2. Computing ϕ by converting the given input data into higher dimensions by applying a Hilbert transformer.
3. Computing Kernel matrices (K_x and K_y) by applying rbf function to the input data.
4. Finding eigenvectors by solving Lagrange's equation using SVD.
5. Final resultant projections (w_x , w_y) are obtained by multiplying computed eigenvectors (a , b) and ϕ .
6. Final transform matrix is obtained by multiplying resultant projection matrices (w_x , w_y) with given input (X , Y).

Chapter 4

Documentation API

4.1 Package organization

```
from KCCA import KCCA  
kcca_object = KCCA()
```

Parameters:

X : ndarray, [n, p]

Matrix of one feature space.

Y : ndarray, [n, q]

Matrix of second feature space.

Methods :

1. *fit(X, Y)*

Fit model to data.

Parameters:

X : ndarray, (n*p)

where p is a feature and n is a number of samples.

Y : ndarray, n*q

where q is a feature and n is a number of samples.

Output : projection matrices wx, wy are ndarrays of dimension n*n each.

2. *Kcca_object.fit_transform(X, Y)*

Gives the transformed kcca matrix

Parameters:

X : ndarray, (n*p)

where p is a feature and n is a number of samples.

Y : ndarray, n*q

where q is a feature and n is a number of samples.

Output : KCCA transformed matrices Xnew, Ynew.

Chapter 5

Example

```
#importing package
from KCCA import KCCA
import numpy as np

#inputData()
sigma = 1
mu = 0
x = np.random.normal(mu,sigma, 8)
X = x.reshape(4,2)
y = np.random.normal(mu,sigma, 12)
Y = y.reshape(4,3)

#make Object by calling KCCA
kcca=KCCA()
```

```
#fitting data
wx,wy=kcca.fit(X,Y)
print("Projections: ")
print("Wx :: ",wx)
print("Wy :: ",wy)

Projections:
Wx :: [[ 0.51120985 -0.13264769  0.09310304  0.02670864]
 [ 0.24827265  0.77708283  0.01482608  0.00856369]

 [ 6.84003271e-02  7.84534460e-02  4.21640915e-02]
 [-1.48118418e-03 -1.56865924e-03 -9.23200984e-04]]
```

Chapter 6

Learning Outcomes

- We got a deeper knowledge of how CCA works by combining various views into one single space.
- We implemented Hilbert transform and the theory behind Hilbert space.
- Studied a non-linear kernel like Gaussian RBF and implemented it.
- Learned about singular value decomposition (svd) for computing Lagrange's equations.
